The Royal Society, the national academy of science of the UK and the Commonwealth, is at the cutting edge of scientific progress. We support many top young scientists, engineers and technologists, influence science policy, debate scientific issues with the public and much more. We are an independent, charitable body and derive our authoritative status from over 1400 Fellows and Foreign Members.

During 2010, we are celebrating the Royal Society’s 350th anniversary. As part of this, there will be an exciting programme of activities – exhibitions, lectures, conferences, a new book, a vast science festival on the South Bank in London, television and radio broadcasting and much more besides.

Our mission: to expand knowledge and further the role of science and engineering in making the world a better place.

The Royal Society’s strategic priorities are to:
• invest in future scientific leaders and in innovation,
• influence policymaking with the best scientific advice,
• invigorate science and mathematics education,
• increase access to the best science internationally, and
• inspire an interest in the joy, wonder and excitement of scientific discovery.

Cover image: Computer artwork of white light being refracted as it passes through two equilateral triangular prisms. Light changes direction, or is refracted, when it meets a different transparent medium such as a prism. An equilateral triangular prism disperses the white light into its component colours, producing the colour spectrum. Copyright © David Parker/Science Photo Library.
